Outline

Introduction

- **Paper:** Physical interpretation of the anomalous Cherenkov rings observed with the DELPHI detector
  - arXiv:2001.08576
  - Not submitted to any peer-reviewed journals
  - Retired HEP scientists
  - Independent of DELPHI Collaboration
- **Idea:** Interpret large Cherenkov rings as tachyons
- **Aim:** Measure mass parameter

DELPHI and RICH

- DELPHI: Detector with Lepton, Photon and Hadron Identification
  - One of four main detectors at LEP
  - Operated from 1989 to 2000
  - Used RICH for particle ID
- DELPHI Barrel RICH:
  - Cherenkov angle: $\cos(\theta) = \frac{1}{n\beta}$
  - C_6F_{14} liquid radiator ($n = 1.273 \implies \theta_{\text{max}} = 667\,\text{mrad}$)
  - C_5F_{12} gaseous radiator($n = 1.00194 \implies \theta_{\text{max}} = 62\,\text{mrad}$)

DELPHI and RICH

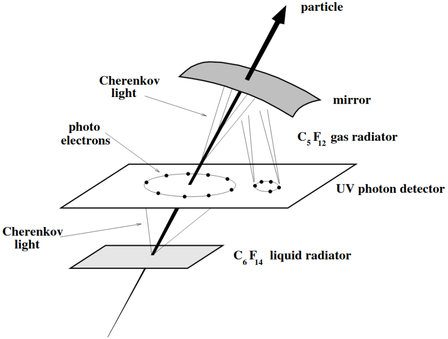

Figure 1: Principles of the DELPHI RICH detector

- DELPHI strategy: Fit rings with five mass hypotheses (e, μ, π, K, p) $\implies$ obtain Cherenkov angle
- This paper: Fit each photon direction individually

Tachyon particles

- Particles moving at $\beta > 1$
- $E^2 - p^2 = -\mu^2$
- μ: Mass parameter

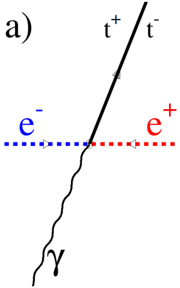
Tachyon mass parameter and Cherenkov angle

$$\mu = p\sqrt{1 - n^2\cos^2(\theta)}$$

Event topologies and candidate selection

Topology 1: $e^+e^- \to \gamma t^+t^-$

- High energy photon back-to-back with tachyons
- Signature:
  - One neutral and one charged jet
  - Use $\mathrm{d}E\,/\,\mathrm{d}x$ to distinguish from single tracks
  - EM shower



Event topologies and candidate selection

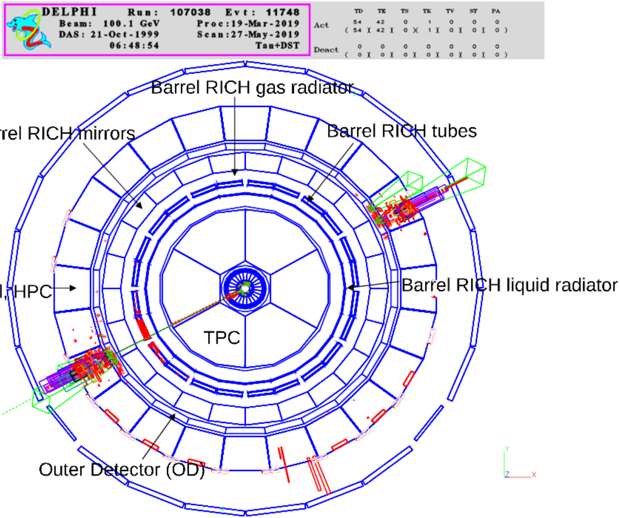


Figure 2: $e^+e^- \to \gamma t^+t^-$ event

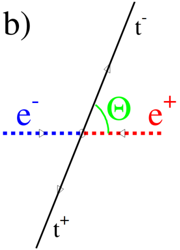
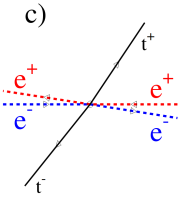
Event topologies and candidate selection

Topology 2a: $e^+e^- \to t^+t^-$, 2b: $e^+e^- \to e^+e^-t^+t^-$

- Tachyon pair production
- Signature:
  - Tracks in opposite directions and opposite charge
  - EM shower





Event topologies and candidate selection

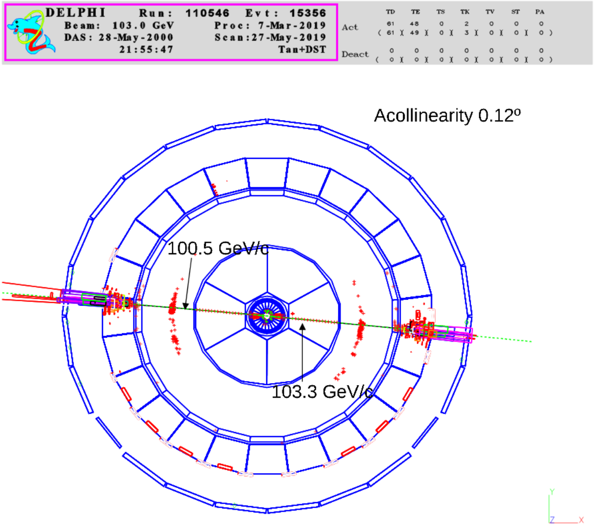


Figure 4: $e^+e^- \rightarrow t^+t^-$ event

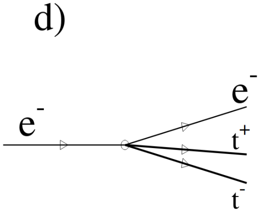
Event topologies and candidate selection

Topology 3: $eX \to eX' t^+ t^-$

- $e^\pm$ interaction with matter to produce tachyons
- Signature:
  - 1 single track jet, one with 3 charged tracks
  - Non-zero impact parameters in the three-particle jet
  - EM shower



Event topologies and candidate selection

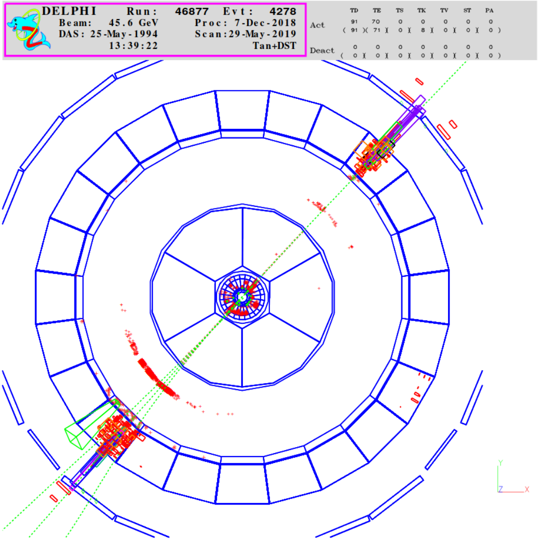


Figure 5: $eX \to eX' t^+ t^-$ event

Event topologies and candidate selection

Result after selection:

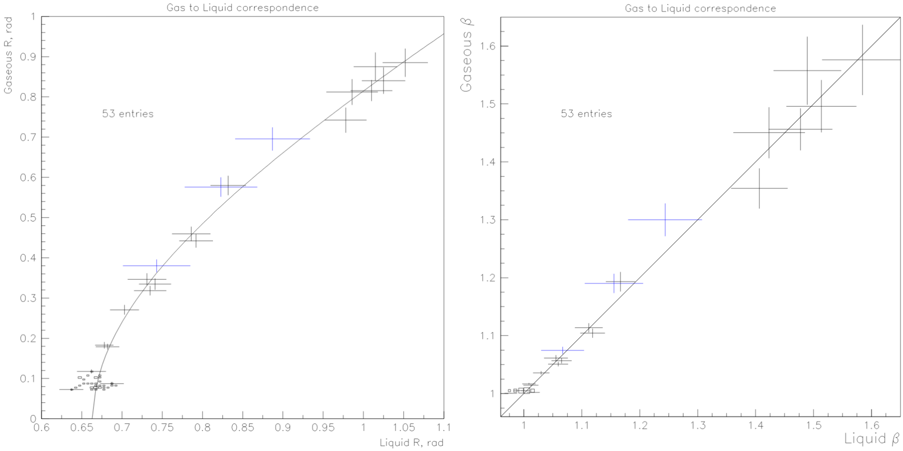
- 53 events with at least one anomalous Cherenkov ring
- 29 candidates had two anomalous rings per track

Correlation between RICH detectors

- From Cherenkov angle formula:
  - $n_1 \cos(\theta_1) = \frac{1}{\beta} = n_2 \cos(\theta_2)$
  - Can plot this as a line in the θ_1 vs θ_2 plane

- Or plot the predicted speeds β_1 and β_2

Correlation between RICH detectors



(a) Gas to liquid angle correlation

(b) Gas to liquid speed correlation

Tachyon mass parameters

- Calculate the mass parameters μ from Cherenkov angles
- Find correlation of μ between tachyon pairs

Tachyon mass parameter and Cherenkov angle

$$\mu = p\sqrt{1 - n^2\cos^2(\theta)}$$

Tachyon mass parameters

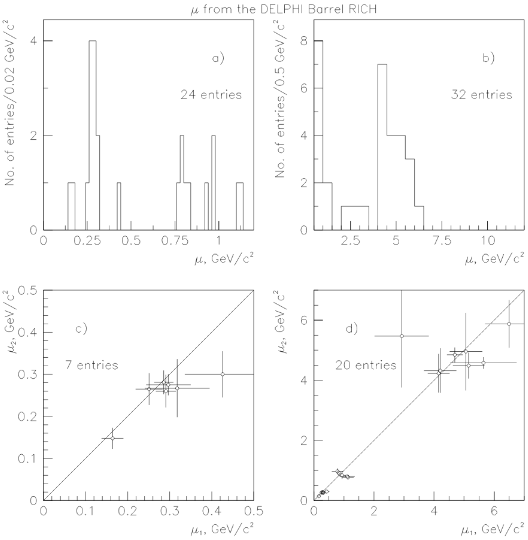


Figure 7: Tachyon mass parameters μ

Kinematic fit

- Do an over-constrained kinematic fit
- μ is a free parameter
- Constraints:
  - Energy-momentum conservation
  - $\mu = p\sqrt{1 - n^2\cos^2(\theta)}$

Kinematic fit

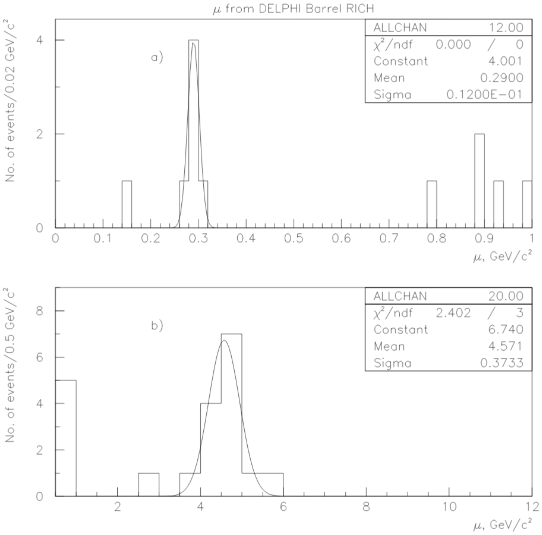

Figure 8: Tachyon mass parameters μ after kinematic fit

Conclusion

- Anomalous Cherenkov rings at DELPHI have been interpreted as tachyons
- Consistency checks show good agreement
- **Authors claim:** Tachyon mass parameters show an excess at $\underline{(0.29 \pm 0.01)\,\text{GeV}}$ and $\underline{(4.6 \pm 0.2)\,\text{GeV}}$
- Further experiments are needed to confirm or refute these findings
  - $\gamma\gamma$ interactions (topology $2b$) at ALICE have Z^2 enhancement in cross section
  - LHCb, with high RICH Cherenkov angle resolution, could use low multiplicity events
